

Construct an "unfolded" hypercube (see Exercise 13 in Section 6.2). By "unfolded hypercube", please note that I mean the 3D version, not something that's been unfolded again into 2 dimensions. Figure out, by looking at the analogous unfolded cube and matching edges, which faces would connect to which if we were able to fold it back into the hypercube, and color-code those faces which would connect to each other.

Write a page or so explaining the basic idea of the hypercube, why this is what it looks like "unfolded", and how you figured out which faces would connect to which.

*Possible points:* A 3D unfolded hypercube out of paper, with the faces correctly colored could earn up to 20 points. (Something more elaborate, out of material other than paper, could of course earn more).
